/ncte="Organ: pooled; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHL19W, testis NHT, and B-cell NCI_CGAP_GCBI) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-72871, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo.

           /notee organ: lung; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; 1st strand cDNA was prepared from neuroendocrine lung carcinoid, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo."

/note="Organ: pooled; Vector: p1713D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHil9W, testis NHT, and B-cell NCI_CGAP_GCBI) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-72871, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo.

/note="Organ: lung; Vector: pT/T3D-Pac (Pharmacia) with a modified polylinker; lst strand cDNA was prepared from neuroendocrine lung carcinoid, and was then primed with a neuroendocrine lung carcinoid, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT/T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. "

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 4, Application US/08625198

Sequence 4. Application US/08625198

Patent No. 5756324

GENERAL INFORMATION:
APPLICANT: Baszczynski, Chris
APPLICANT: Battori, Jiro
APPLICANT: Hattori, Jiro
APPLICANT: Miki, Brian
TITLE OF INVENTION: MICROSPORE-SPECIFIC REGULATORY ELEMENT
NUMBER OF SEQUENCES: 8
CORRESPONDENCE ADDRESS:
                                                                                              GENERAL INFORMATION:

Sequence 4, Application US/08095068
Patent No. 5362643
GENERAL INFORMATION:
APPLICANT: Chang, Tse Wen; Chang, Nancy T.
APPLICANT: Chang, Tse Wen; Chang, nancy T.
TITLE OF INVENTION: Producing antibodies which bind to membrane-bound 1gA using; TITLE OF INVENTION: an immunogen
NUMBER OF SEQUENCES: 19
CORRESPONDENCE ADDRESS:
ADDRESSEE: Tanox Blosystems, Inc.
STREET: 10301 Stella Link Rd.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 30;

Multiplex short-PCR primer for retinoblastoma gene exon 23.

Two dimensional gene scanning; TDGS; polymerase chain reaction; PCR; electrophoresis; mutation; detection; simultaneous; multiplex amplification; short distance PCR; ss.

Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                           25-5FP-1993 (first entry)
Sequence of PCR primer oligo 2 for the amplification of the Soliovirus genome from positions i to 740.
Recombinant virus; proteolytic cleavage site; vaccine; exogneous nucleic acid; replication competent; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          68.0%; Score 13.6; DB 1; Length 45; 80.0%; Pred. Claim 1; Page 20; 56pp; English.

This invention describes nucleic acid segments represented in This invention describes nucleic acid segments of the polymorphism state of the polymorphisms is useful (1) to their complements. Analysis of the polymorphisms at useful (1) to correlate the polymorphisms with phenotypic traits, e.g. for diagnosis of inclammatory and nervous system disorders, cancer, infections etc., also in animals and plants to identify individuals for breeding programs, (3) to identify physical characteristics, response to drugs or therapy, also in animals and plants to identify individuals for breeding programs, (3) to identify physical linkage between nucleic acid segments and a specific genetic locus, associated with a trait for gene mapping and for genetic locus, associated with a trait for gene mapping and for the invention may also be used for treatment or prevention of the specified diseases.
                                                                                                                          fragments on basis or size and base part sequence.

Enedetermined gene exons derived from DNA can be analysed by a new bredetermined gene exons derived from the common tube, i.e.

The gene exons followed by PCR amplifications in a common tube, i.e. multiplex long PCR; (b) adding further primer pairs specific to each coff the gene exons followed by PCR amplifications in a common tube, coff the gene exons followed by PCR amplifications in a common tube, coff the gene exons followed by PCR amplifications in a common tube, coff the gene exons followed by ENR amplifications in a common tube, separating the gene fragments. Using the method, all possible mutations in the gene(s) can be detected simultaneously based on a minimal number coff two-step multiplex PCR reactions in combination with automatic two-dimensional separation of the fragments. In a specific example of the new method, mutations in the retinoblastoma gene were detected using 6 pairs of primers for the initial, long-PCR followed by short-PCR amplifications using one pair of primers in each compined to obtain all the products and to allow detection of mutations based on length polymorphisms.

Engage 2.14 and 17-27. For the single compine in each common pair and a 5'-GC clamp. It was found that 5 ng of genomic DNA was common and a followed by some pair of primers in each common pair and a followed by an applymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human genomic DNA polymorphic site sequence tag 663.

Claim 48: Yange 2/17; SWPPP; Surguisn.

A DNA protein-binding assay is provided, useful for screening libraries of synthetic or biological codes. for their ability contributions of synthetic or biological codes. for their ability is brindly described by placing the test sequences. The assay is versatile in that any communer of test sequences. The assay is versatile in that any common to a defined protein-binding screening sequence. Binding sequence. Binding sequence. Mans such a mol. of mols. to these test sequences changes the binding characteristics of the protein mol. to its compate binding sequence. When such a mol. binds the test sequence, the equilibrium of the DNA:protein complexes is disturbed, generating changes in the concentration of free DNA probe. One application of this method is to eucaryotic general transcription factor. Numerous exemplary test sequences are given: transcription factor. Numerous exemplary test sequences are given: transcription factor. Numerous exemplary test sequences are given: the sequences in 069513-731 and 069850 correspond to prometer targets (typically, TATA box-contg. sites) for human genes and the sequences in 069732-849 correspond to promoter targets for viral genes. The test sequences may also be randomly generated. DNA:protein interaction may be used for screening purposes, e.g. the Herpes Simplex Virus (HSV) origin of replication and UL9 (see 069831-52, 069865 and 069801).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   pharmaceuticals and as molecular reagents
Claim 28; Page 383; 587pp; English.
Chan DNA protein-binding assay is provided, useful for screening
Libraries of synthetic or biological cpds. for their ability
Libraries of synthetic or biological cpds. for their ability
Chan DNA test sequences. The assay is versatile in that any
cumber of test sequences can be tested by placing the test sequence
adjacent to a defined protein binding screening sequence. Binding
Coffined protein mol. to its cognate binding sequence. When such a mol.
Coffine test sequence, the equilibrium of the DNA; protein complexes
Is disturbed, generating changes in the concentration of free DNA probe.
Cone application of this method is to eucaryotic general transcription
factors (e.g. TFILD), where the target region is typically selected
from DNA sequences adjacent to the binding site for the eucaryotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA protein-binding assay; test sequence; screening sequence; promoter; target; TATA box; Herpes Simplex Virus; HSV; origin of replication; UL9; transcription factor; TFIID: ds.

Claim 1; Page 23; 56pp; English.

This invention describes nucleic acid segments represented in x18554-x19408 which are isolated from any of about 750 human genomic regions given in the specification that include a polymorphic site, or their complements. Analysis of the polymorphisms is useful (1) to correlate the polymorphisms with phenotypic traits, e.g. for diagnosis of inflammatory and nervous system disorders, cancer, infections etc., also correlate the polymorphisms with phenotypic traits, e.g. for diagnosis of inflammatory and nervous system disorders, cancer, infections etc., also correlate the polymorphisms with phenotypic traits, e.g. for diagnosis of nammatory and nervous system disorders, cancer, infections etc., also correlate the polymorphisms with individuals for breeding programs, (3) in animals and plants to identify individuals for breeding programs, (3) consequent clouds associated with a trait for gene mapping and for subsequent clouing of the gene responsible for the trait. The products of the invention may also be used for treatment or prevention of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in T63713-4312 represent duplex DNA's which act
as target regions in the method of the invention. The method for
altering the binding characteristics of a DNA-binding protein to duplex
DNA comprises contacting the duplex DNA with a small molecule which
binds sequence-specifically to a target region, where, when the small
concleule is bound to the target region, where, when the small
coverlapping by more than 4 bp, a binding site for a DNA-binding protein.
The small molecule is added at a concentration effective to alter the
coverlapping by more than 4 bp, a binding site for a DNA-binding protein.
The small molecule is added at a concentration effective to alter the
confloring of the DNA binding protein, pref. TFIID, to its binding site on
the duplex DNA. The binding of the small molecule may inhibit or enhance
the binding of the DNA-binding of contentially useful as
therapeutic agents for treatment of any disease which involves a
specific DNA sequence, e.g. cancer, or inherited genetic disorders etc.
The method is suitable for screening large biological or chemical
illuraries and allows determination of sequence-specific and relative
affinities of known DNA-binding agents for different DNA sequences.
The dealgn of these duplex DNA's allows a single DNA:protein interaction
the dealgn of these duplex DNA's allows a single DNA:protein interaction
the used for screening sequence-specific, or preferential, DNA binding
                                                                                                                                                                                                       ö
transcription factor. Numerous exemplary test sequences are given: the sequences in 060251-731 and 060850 correspond to promoter targets (typically, TATA box-contg. sites) for human genes and the sequences in 060732-849 correspond to promoter targets for viral genes. The test sequences may also be randomly generated. DNA:protein interaction may be used for screening purposes, e.g. the Herpes Simplex Virus (HSV) origin of replication and UL9 (see 069881-52, 069865 and 069891).
                                                                                                                                                                                                                                                                                                                                                                                                       Human fibrinogen gamma chain gene TFIID binding site.

The sequences given in T63713-4312 represent duplex DNA's which act as target regions in T63713-4312 represent duplex DNA's which act as target regions in the method of the invention. The method for altering the binding characteristics of a DNA-binding protein to duplex DNA comprises contacting the duplex DNA with a small molecule which binded to the target region, where, when the small molecule is bound to the target region, where, when the small molecule is bound to the target region, it is adjacent to, but not overlapping by more than 4 bp, a binding site for a DNA-binding protein. The binding of the DNA binding protein, pref. TFIID, to its binding site on the duplex DNA. The binding of the small molecule may inhibit or enhance the binding of the DNA-binding protein to its binding site. The compounds isolated using this method are potentially useful as the specific DNA sequence. e.g. cancer, or inherited genetic disorders etc. The method is suitable for screening large biological or chemical libraries and allows determination of sequence-specific and relative affinities of known DNA-binding agents for different DNA sequences. The design of these duplex DNA's allows a single DNA. sprotein interaction to be used for screening sequence-specific, or preferential, DNA binding proteins that recognise almost any possible sequence (see also T49539-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                         Human fibrinogen gamma chain gene TFIID binding site.

Calim 4 color of the present specifically claimed target test sequences that are used in the method of the invention of determining the DNA sequence preference of a DNA-binding protein to a mixture of duplex DNA test oligonuclectides.

Calimity that is independent of the DNA sequence, where the screening sequence binds to the DNA binding protein with a binding of affinity that is independent of the DNA sequence of the test sequence, and where the mixture of duplex DNA test oligonuclectides includes several test sequences; (ii) incubating the test molecule, the mixture of duplex DNA test oligonuclectides and the DNA-binding protein for a time colligonuclectides bound to binding protein; (iv) amplifying the unbound test oligonuclectides; (v) repeating steps (ii) to (iv); (vi) isolating the amplified test oligonuclectides; and (vii) sequencing the isolated test oligonuclectides; (v) repeating steps (ii) to (iv); (vi) isolating the amplified test oligonuclectides; and (vii) sequencing the isolated test oligonuclectides; (v) repeating steps (ii) to (iv); (vi) isolating correspond to promoter targets for human genes and test sequences X17482-X17599 correspond to promoter targets for human genes and genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        sequence attached to test sequence
Claim 3; Columns 167-168; 270pp; English.
Sequences X17001 to X17600 represent specifically claimed target test
sequences that are used in the method of the invention of determining the
DNA sequence preference of a DNA-binding molecule. The method comprises:
(1) adding a test molecule and a DNA-binding protein to a mixture of
duplex DNA test oligonucleotides, each of the test oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                            Determination of DNA sequence preference of a DNA-binding molecule based on inhibition of binding of protein to oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Determination of DNA sequence preference of a DNA-binding molecule based on inhibition of binding of protein to oligonucleotide

PT New isolated illustrations.

PT treatment of tumors

Example 4; Page 54; 132pp; English.

Example 4; Page 54; 132pp; English.

Containing Ig and EGF homology domains (TIE) ligand of the invention, designated NLB. The TIE receptors are receptor tyrosine kinases which are expressed in vascular endothelial cells and early haemopoietic cells. Containing Ig and EGF homology domains cells and early haemopoietic cells. The TIE receptors are believed to be actively involved in angiogenesis, and may play a role in haemopoiesis as well. The TIE ligand homologs can promote the survival and/or growth and/or differentiation of TIE receptor expressing cells. They can be used for promoting neovascularisation in promoting polateral vascularisation in an ischaemic heart or limb, or for inducing collateral vascularisation in an ischaemic heart or limb, or for promoting bone development and/or maturation and/or growth in a patient or muscle growth and development. The TIE ligand homologs and antibodies can inhibit the growth of endothelial cells and induce apoptosis of cells, particularly the vascularisation of tumour cells. They can inhibit vascularisation of a cell in which a gene encoding an NLI, NLS, CC inhibit vascularisation of a cell in which a gene encoding an NLI, NLS, CC NLB or NLA polypeptide is amplified. The products can also be used for Astartion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
screening sequence binds to the DNA-binding process with a binding and where the mixture of the DNA sequence of the test sequence, and where the mixture of duplex DNA test oligonucleotides includes several test sequences; (ii) incubating the test molecule, the mixture of duplex DNA test oligonucleotides and the DNA-binding protein for a time sufficient to permit binding of the test molecule to test sequences in the duplex DNA; (iii) separating unbound test oligonucleotides from test oligonucleotides bound to binding protein; (iv) amplifying the unbound test oligonucleotides; (v) repeating steps (ii) to (iv); (vi) isolating the amplified test oligonucleotides; and (vii) sequencing the isolated test oligonucleotides. Test sequences X17001-X17481 and X17600 correspond to promoter targets for human genes and test sequences X17789-X17599
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Primer for human TIE ligand NLB coding sequence.
Primer for human TIE ligand NLB coding sequence.
Human TIE ligand; NLJ; NLB; NLB; IS homology domain; angiogenesis; EGF homology domain; receptor tyrosine kinase; vascular endothelial cell; early haemopoietic cell; haemopoiesis; neovascularisation; wound healing; endothelial cell; growth inhibitor; apoptosis inducer; tumour cell; vasculogenesis; detection; diagnosis; therapy; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hillan K, Roy M, Schwall R, Tumas D;

This sequence is a primer for DNA encoding the human tyrosine kinase containing in and ECF homology domains (TIE) ligand of the invention, designated NL5. The TIE receptors are receptor tyrosine kinases which are expressed in vascular endothellal cells and early haemopoletic cells.

The TIE receptors are believed to be actively involved in anglogenesis, and may play a role in haemopolesis as well. The TIE ligand homologs can promote the survival and/or growth and/or differentiation of TIE receptor promote the survival and/or growth and/or differentiation of TIE receptor wound healing and for promoting anglogenic processes, such as for inducing collateral vascularisation in an ischaemic heart or limb, or for promoting bone development and/or maturation and/or growth in a patient commoting bone development. The TIE ligand homologs and antibodies can inhibit the growth of endothelial cells and induce apoptosis of earlishing particularly tumour cells. They can inhibit vascularisation of tumour cells. The a received and antibodies can inhibit vascularisation of a cell in which a gene encoding an NLJ, NLS, NLS, NLS or NLA polypeptide is amplified. The products can also be used for containing and production of transgenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

gastrointestinal ulceration Example 74; page 179; 320pp; English.

Cligonucleotides X52276-53 represent PCR primers and probes used to isolate and amplify cDNA encoding secreted and transmembrane human proteins (see X52217-74 and Y1334-403). The CDNA sequences are obtained from cDNA libraries, prepared from fetal lung, fetal kidney, fetal brain, fetal liver and fetal retina. The encoded polypeptides have specific uses based on their homology to known polypeptides, e.g. PRO211 and PRO217 can be used for disorders associated with the preservation and maintenance of gastrointestinal mucosa and the

DNA Sequencing by: Washington University Genome Sequencing Center
Clone distribution: NCI-CGAP clone distribution information can be found through the I.M.A.G.E. Consortium/LNL at:
analysis were selected following oligonucleotide hybridization fingerprinting of arrayed clones from embridization fingerprinting of arrayed clones from embryonic shield stage (5.6 h) libraries. Fingerprint data were used to computationally cluster cDNAs, and a single cDNA from each cluster was chosen for sequencing. In some cases multiple members of the same cluster were sequenced to assess clustering parameters or single clones were sequenced additional times to assess quality
                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note="Organ: uterus; Vector: pcMV-SPORT6; Site_1: Sall; Site_2: NotI; Cloned unidirectionally. Patent No. 5965124

GENERAL INFORMATION:

APPLICANT: Mark Feinberg, Raul Andino, Carolyn Louise
APPLICANT: Weeks-Levy and Patricia Anne Reilly
TITLE OF INVENTION: Recombinant Vaccines and Method of
TITLE OF INVENTION: Producing Same
NUMBER OF SEQUENCES: 39

CORRESPONDENCE ADDRESS:

ADDRESSEE: Hamilton, Brook, Smith & Reynolds, P.C.
STREEF: 2 Mailitia Drive

Sequence 130, Application US/08171389

Patent No. 5578444

GENERAL INFORMATION:
APPLICANT: Edwards, Cynthia A.
APPLICANT: Andrews, Beth M.
APPLICANT: Turin, Lisa M.
TITLE OF INVENTION: Sequence-Directed DNA Binding
TITLE OF INVENTION: Sequence-Directed DNA Binding
TITLE OF INVENTION: Molecules, Compositions and Methods
NUMBER OF SEQUENCES: 641

CORRESPONDENCE ADDRESS:
ADDRESSEE: Genelabs Technologies, Inc.
STREET: 5505 Penobscot Drive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 45;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    INDIVIDUAL ISOLATE: Human fibrinogen gamma chain gene
